

Flight Operations Risk Assessment System

FORAS Overview
Morristown, New Jersey
August 17-18, 1999

FORAS Team Activities

- ☼ Work officially began in March
- ▮ Progress to date
 - Model selection and development
 - Knowledge elicitation and representation
 - Systems analysis
 - System design (including coding and testing)
 - Weather database design and development

Industry Collaborations

☼ UAL

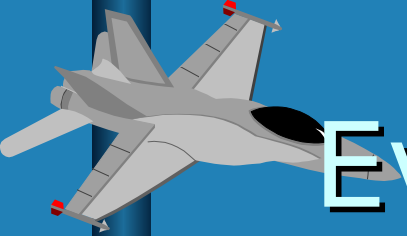

- Expert elicitation sessions: Pilots, Dispatchers, Flight Attendants
- Data discussions: Information Systems, Meteorology, and Safety

▮ Airbus Industrie

- Data discussions: Training and Flight Operations Support
- Line Operations Monitoring System (LOMS) discussions: Training and Flight Operations Support

▮ ATC

- Process discussions: Monterey and Daytona Beach

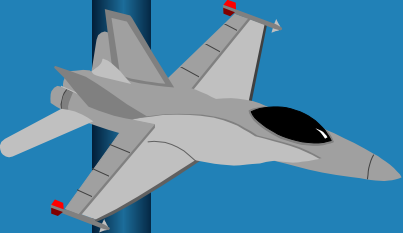

Evolution of FORAS Model

☼ Phase I

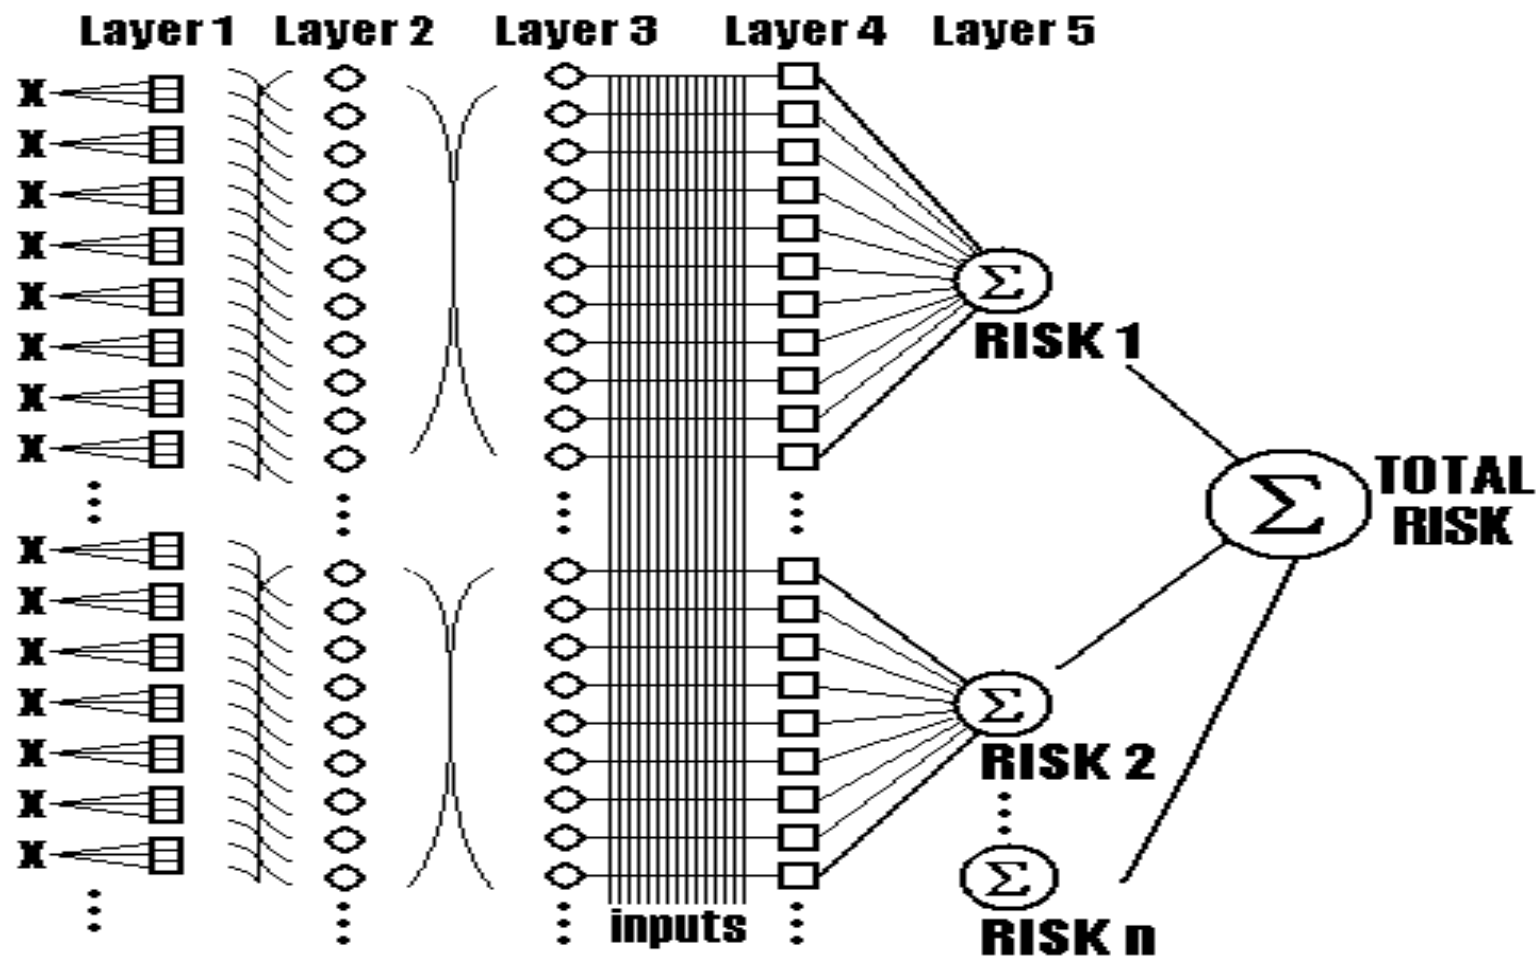

- Identify significant inputs
- Structure and prioritize inputs (AHP)

▮ Phase II

- Elicit knowledge base from experts
- Quantify knowledge base (fuzzy approach)
- Model complex interactions (neural net)
- Refine model parameters

Network Structure

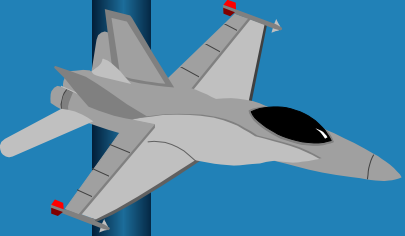

FORAS Phase II Project Plan

FORAS Vision

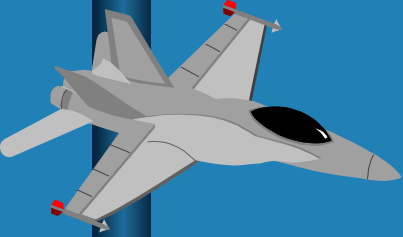

A system for the assessment and mitigation of risk associated with flight operations.

A quantitative value indicating the relative risk level for various flight operations-related risks.

Examples: CFIT, TII (turbulence-induced injuries), mid-air collision, approach&landing, loss of control

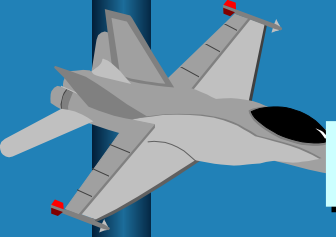

Operations-level, regional, per-flight.

Summary levels: e.g. by airport, sector, equipment

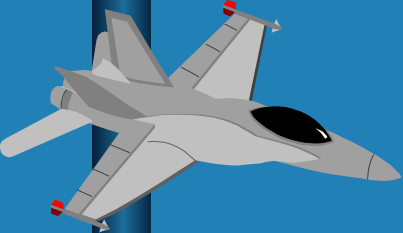

User Feature Overview

- ▮ Used by safety managers, dispatchers, and others;
- ▮ Both summary and real-time analyses: charts/graphs, statistics, system-integrated output;
- ▮ Multilevel analysis: “drill-down” exploration of risk structure;
- ▮ Multicategory risk analysis;
- ▮ Expert system-supplied mitigative strategies.

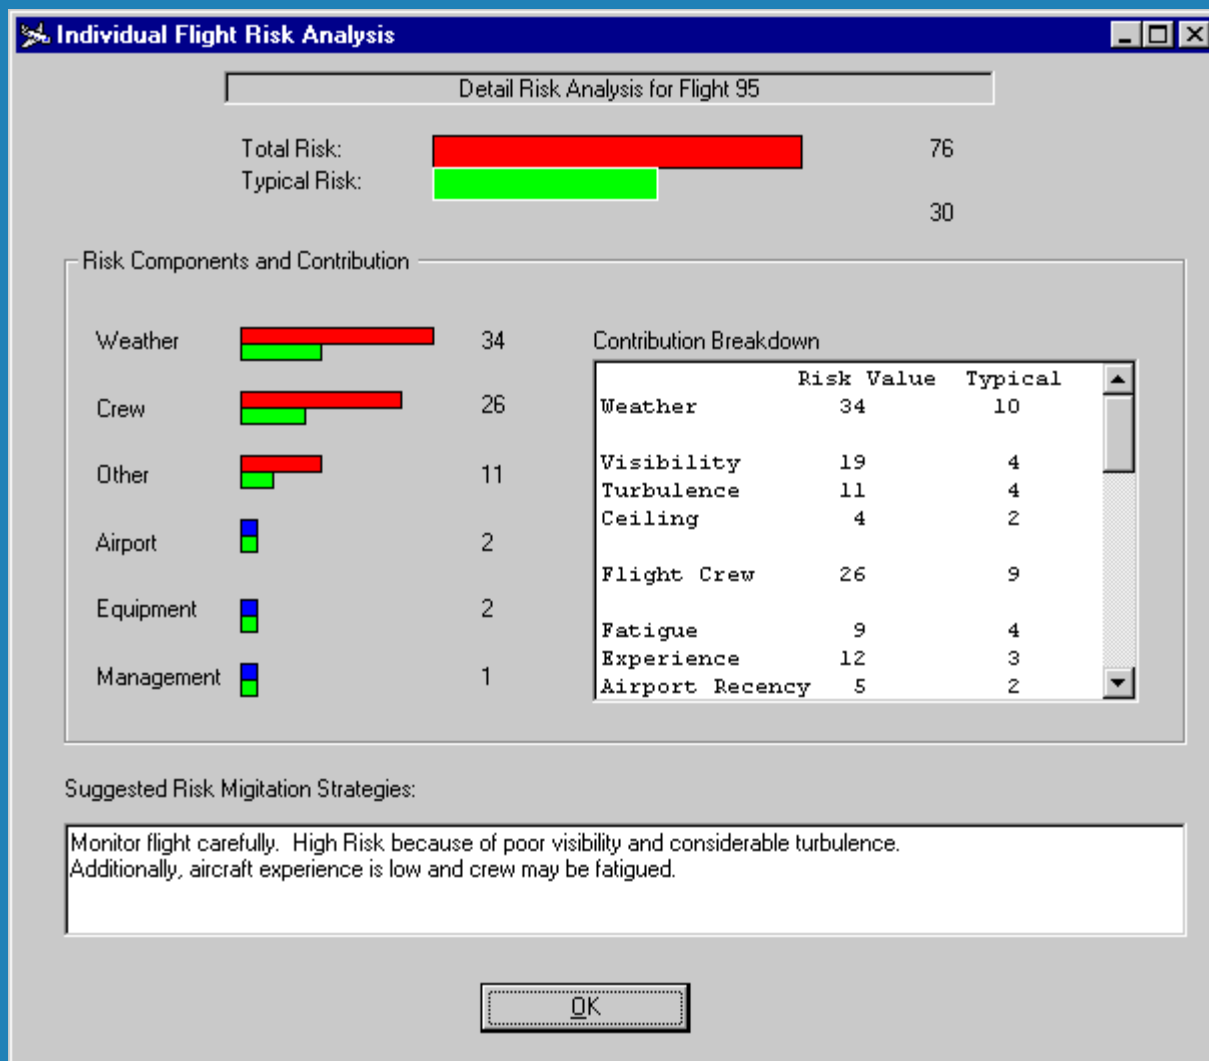

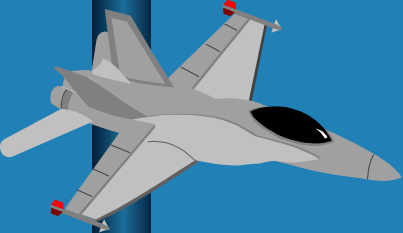

Example users and usage

- Safety Manager examples:
 - operations-level analysis of CFIT risk,
 - approach&landing risk for all flights into MRY,
 - effect of route changes or crew scheduling policy on overall relative risk.
- Make routing/scheduling decisions,
- Analyze effects of some safety policy decisions,

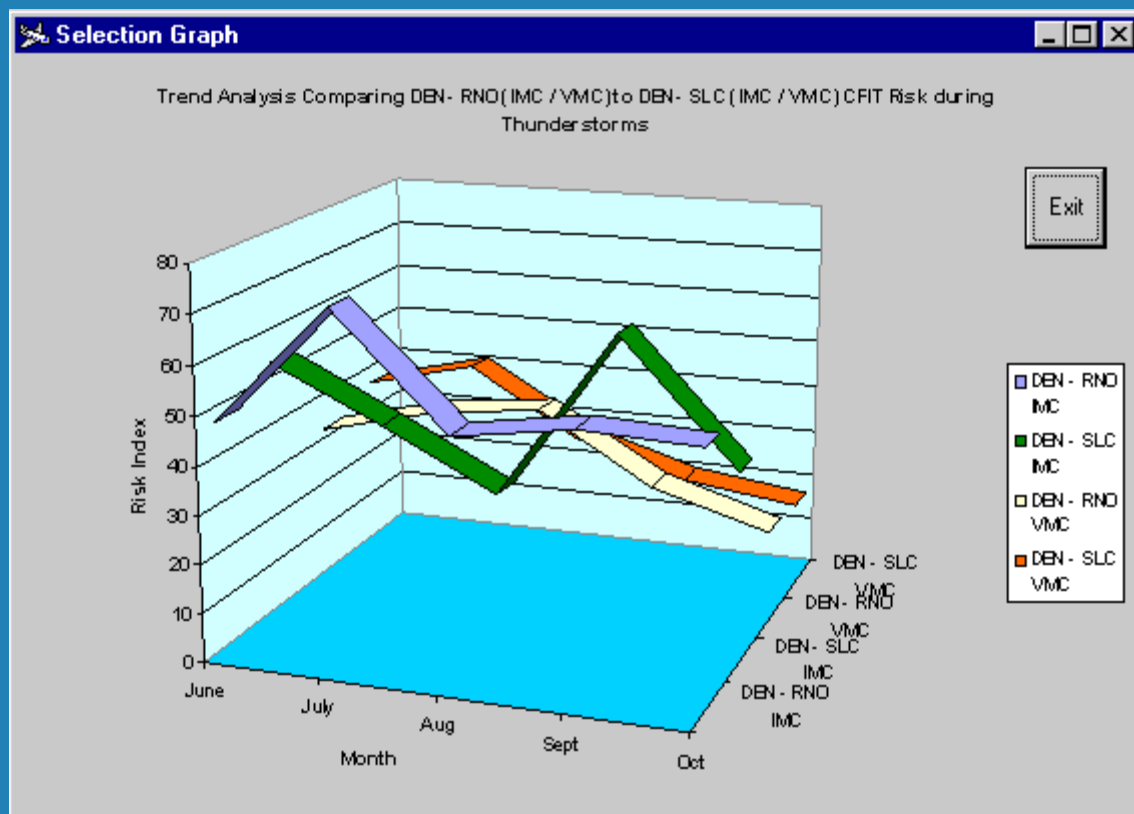

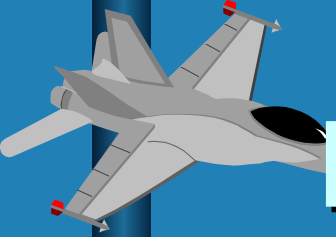

FORAS Output: Flight Ops

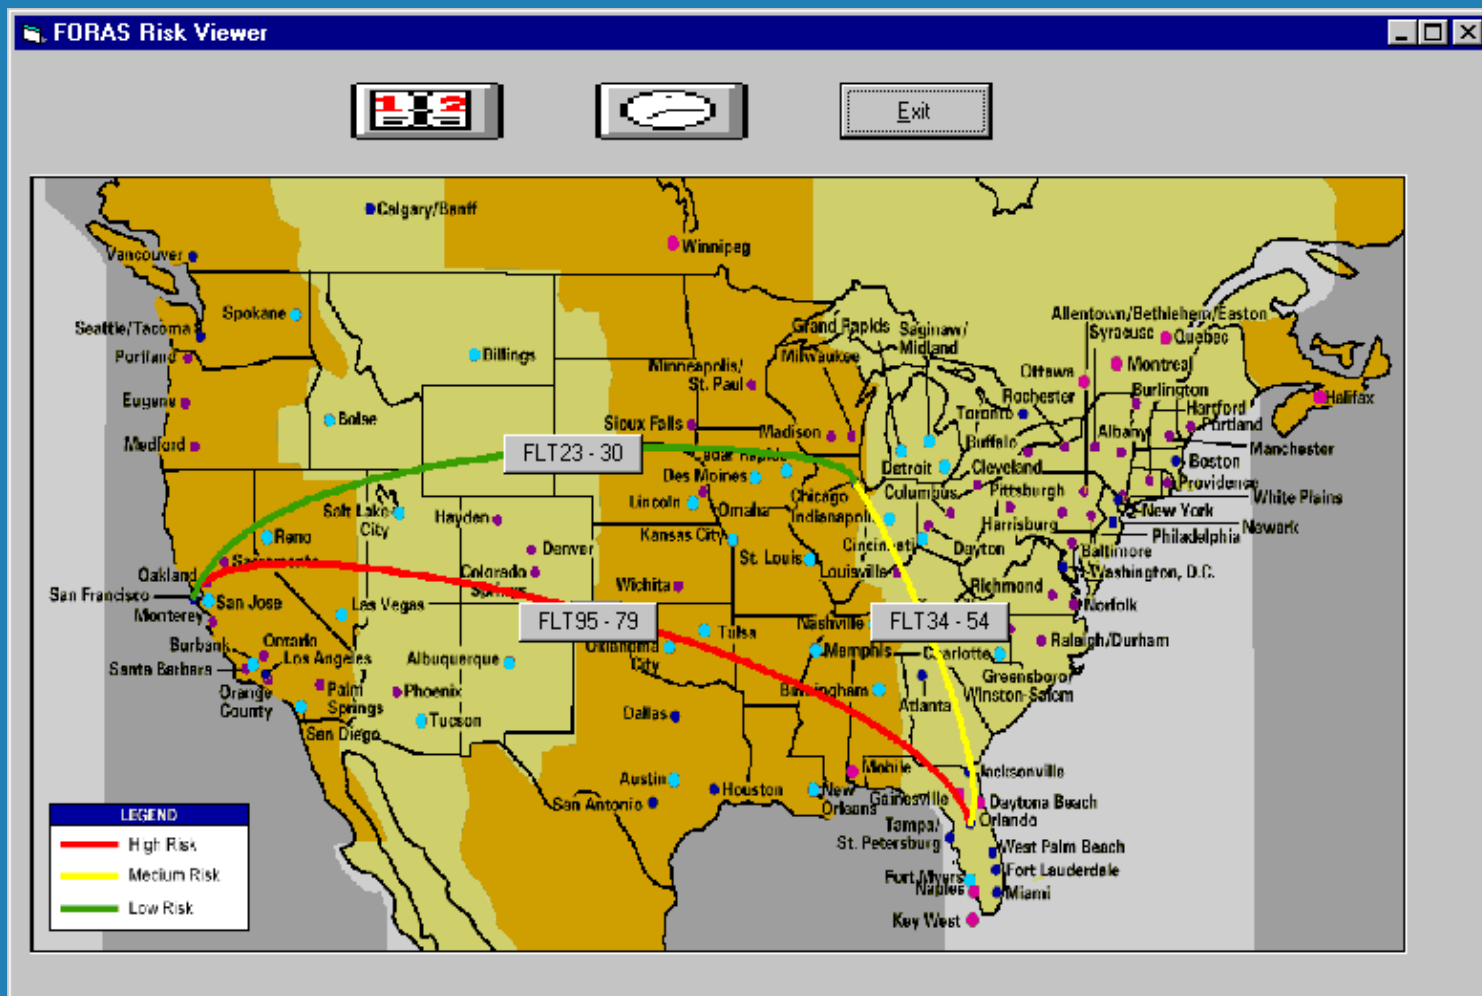

FORAS Output: Safety Manager

Example users and usage

-  Dispatcher: e.g.,
 - Overall relative risk for each of the day's flights.
 - Make real-time decisions about flight scheduling, routing, etc.
 - Identify high priority (high risk) flights before departure.

FORAS Output: Safety Manag

System

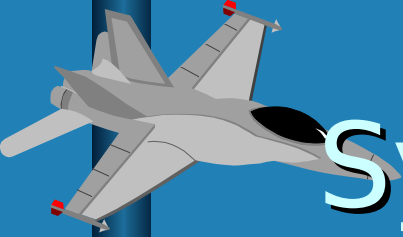

A **system** for the assessment of risks associated with flight operations:

- Software
- Network connectivity
- Online data sources
- Reporting system

The System

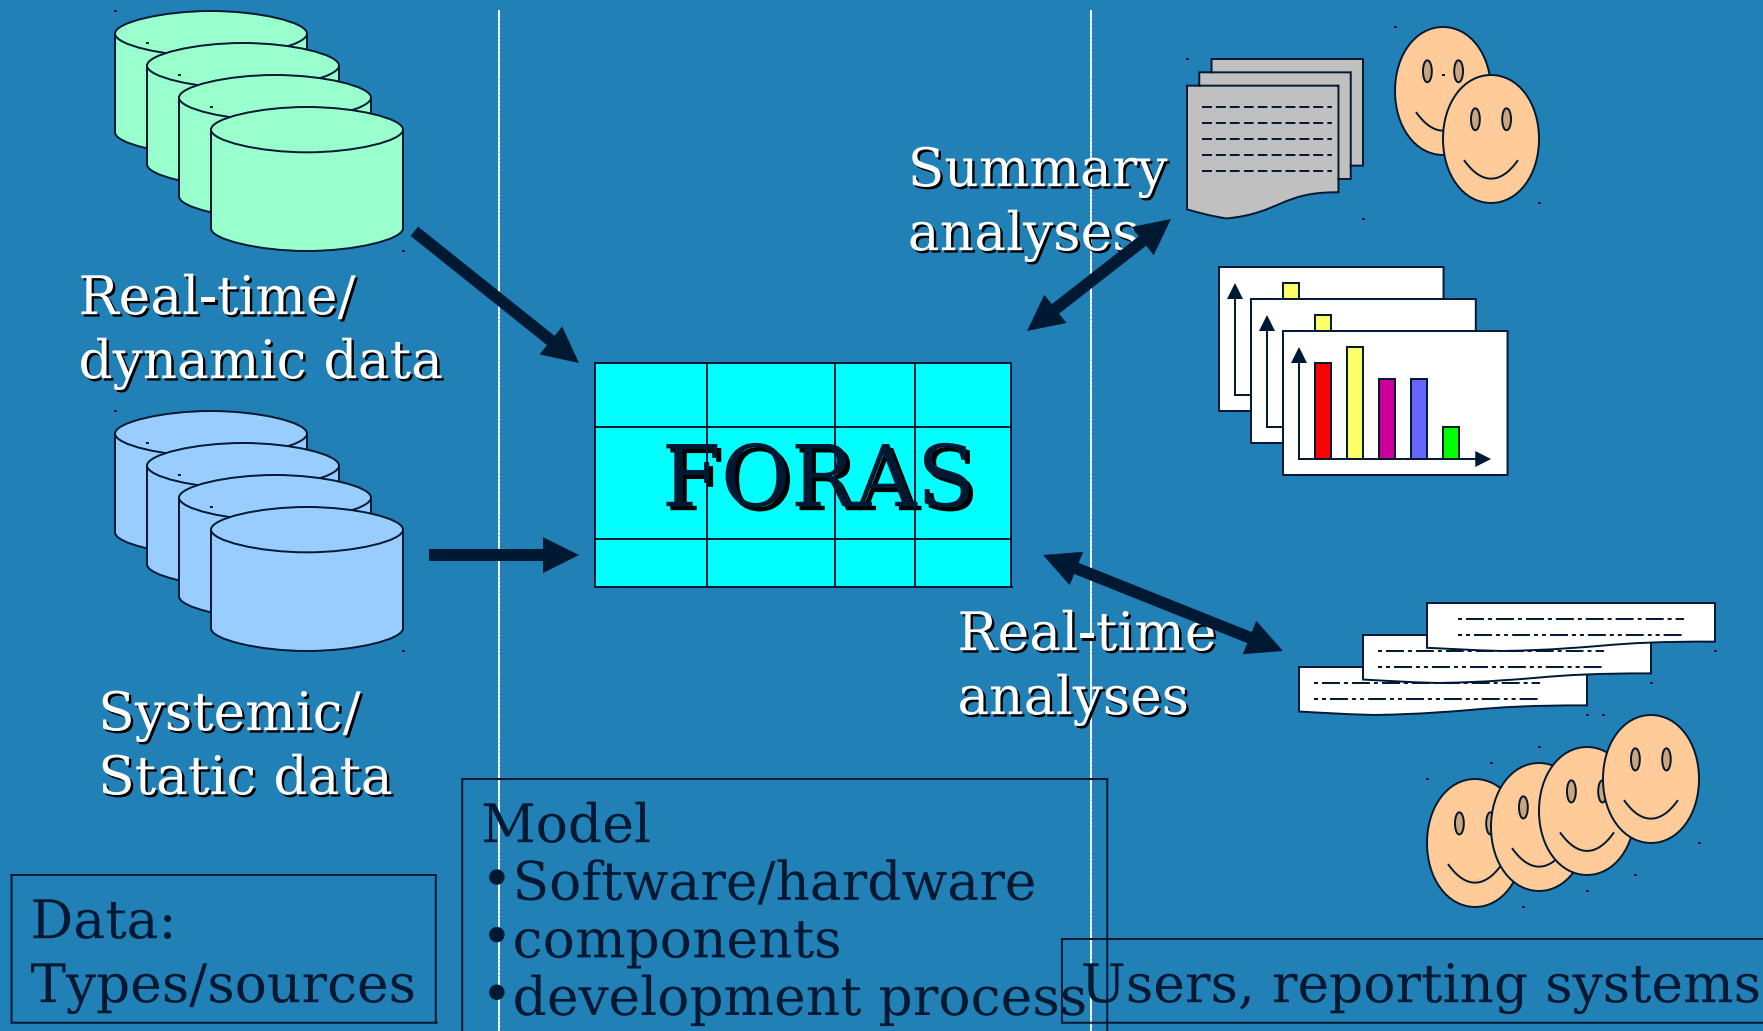

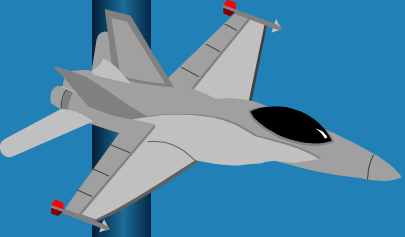

System Feature Overview

- ⚙ **Client-server model** makes results available organization-wide: central processing, distributed reporting.
- ▢ **Modular design** allows simple model updates: plug-in modules can quickly add and update risk structures.
- ▢ **Self-training**: relative risk attribute weights dynamically adjusted according to feedback.

The System

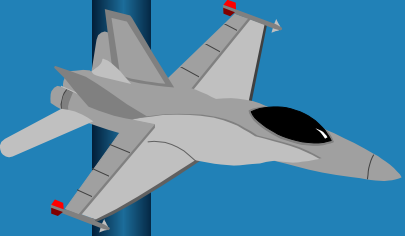

Data Types

☼ Real-time/dynamic:

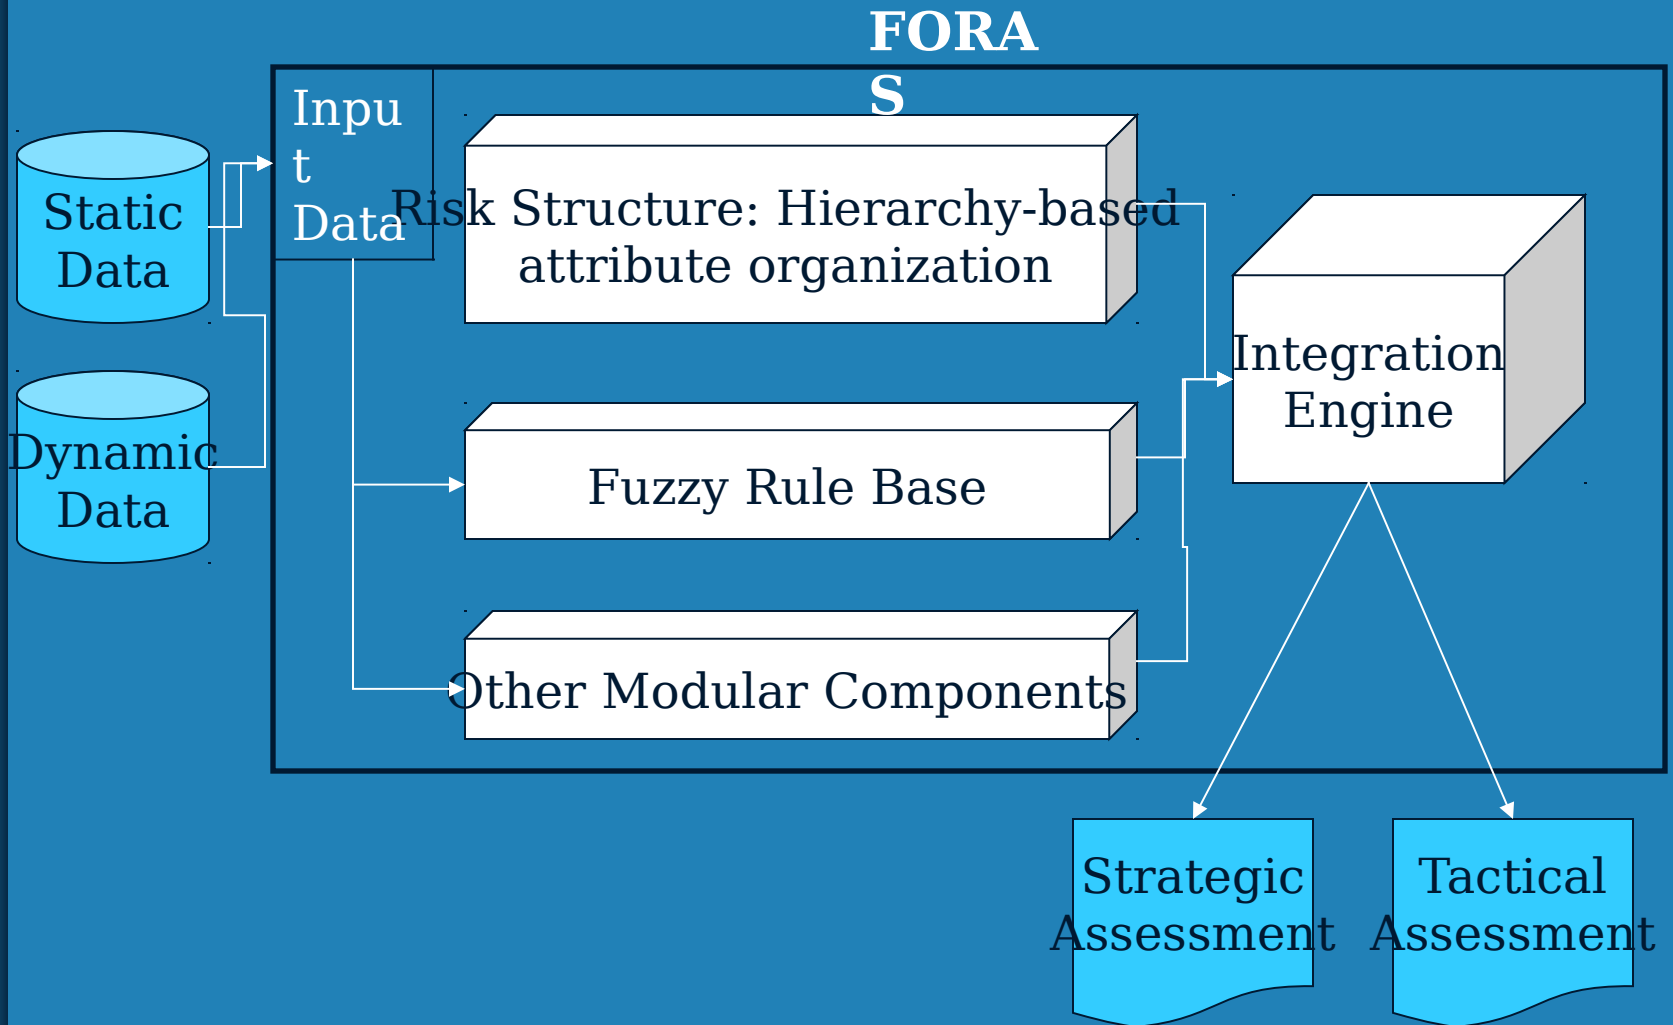

- e.g., current weather conditions/forecasts, current airport capacity, crew assignments, equipment, air traffic, etc.

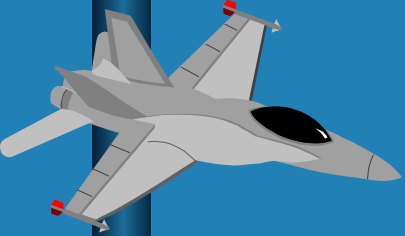

☼ Systemic/static:

- e.g., climatological, airport equipment/terrain/capacity, management safety policies, crew scheduling policies, crew experience, dispatch experience, etc.

FORAS -- The Flight Operations Risk Assessment System

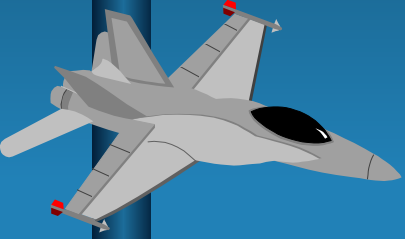

What is FORAS?

The Flight Operations Risk Assessment System (FORAS) is a risk management tool that will assess accident/incident risk associated with a flight operation. FORAS is designed to give safety managers and other users a quantitative assessment of specific risk for an operation, broken down into a variety of subgroups: by fleet, region, route, or even individual flight. This assessment is performed using a mathematical model which synthesizes a variety of inputs, including information on crew, weather, management policy and procedures, airports, traffic flow, aircraft, and dispatch operations. The system will identify those elements that contribute most significantly to the calculated risk, and will be able in some cases to suggest possible interventions.

Who will use FORAS?

FORAS will be useful to a flight operation at all levels of the operational hierarchy, from safety managers to individual flight dispatchers. Safety managers can assess the overall level of certain risks for their operation, and analyze the effects of management decisions on that risk level. Various risks can be tracked over time to analyze trends, and cost-benefit analyses can be conducted to compute the "value" of safety investments (in terms of reduced risk). A flight operation, such as an air carrier, will benefit from FORAS by having a more continuous, up-to-date, objective, and encompassing assessment and understanding of its exposure to various risk categories.

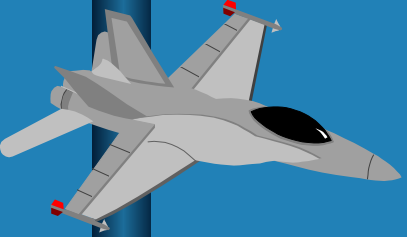

Current FORAS Activities

Flight Operations Risk Assessment System

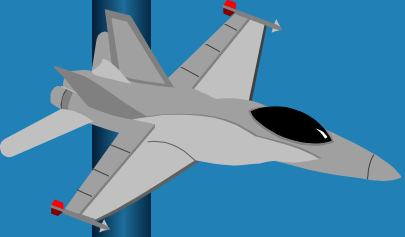

FORAS

Technical Product Demonstration

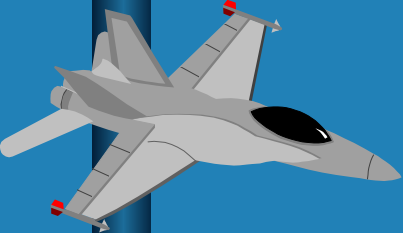

Representing a Rule Conclusion

- ⦿ Sugeno Method: Risk contribution for each rule is of the form $R = a_0 + a_1 x_1 + a_2 x_2$
- ▮ Example: If In-type hours are *medium* and block time is *high*, then
$$R = 0.8 - 0.6 x_1 - 0.2 x_2$$
- ▮ Normalized inputs: x 's
- ▮ Conclusion parameters: a 's
 - Parameters are “trained” to adapt to the risk estimates for a set of flights

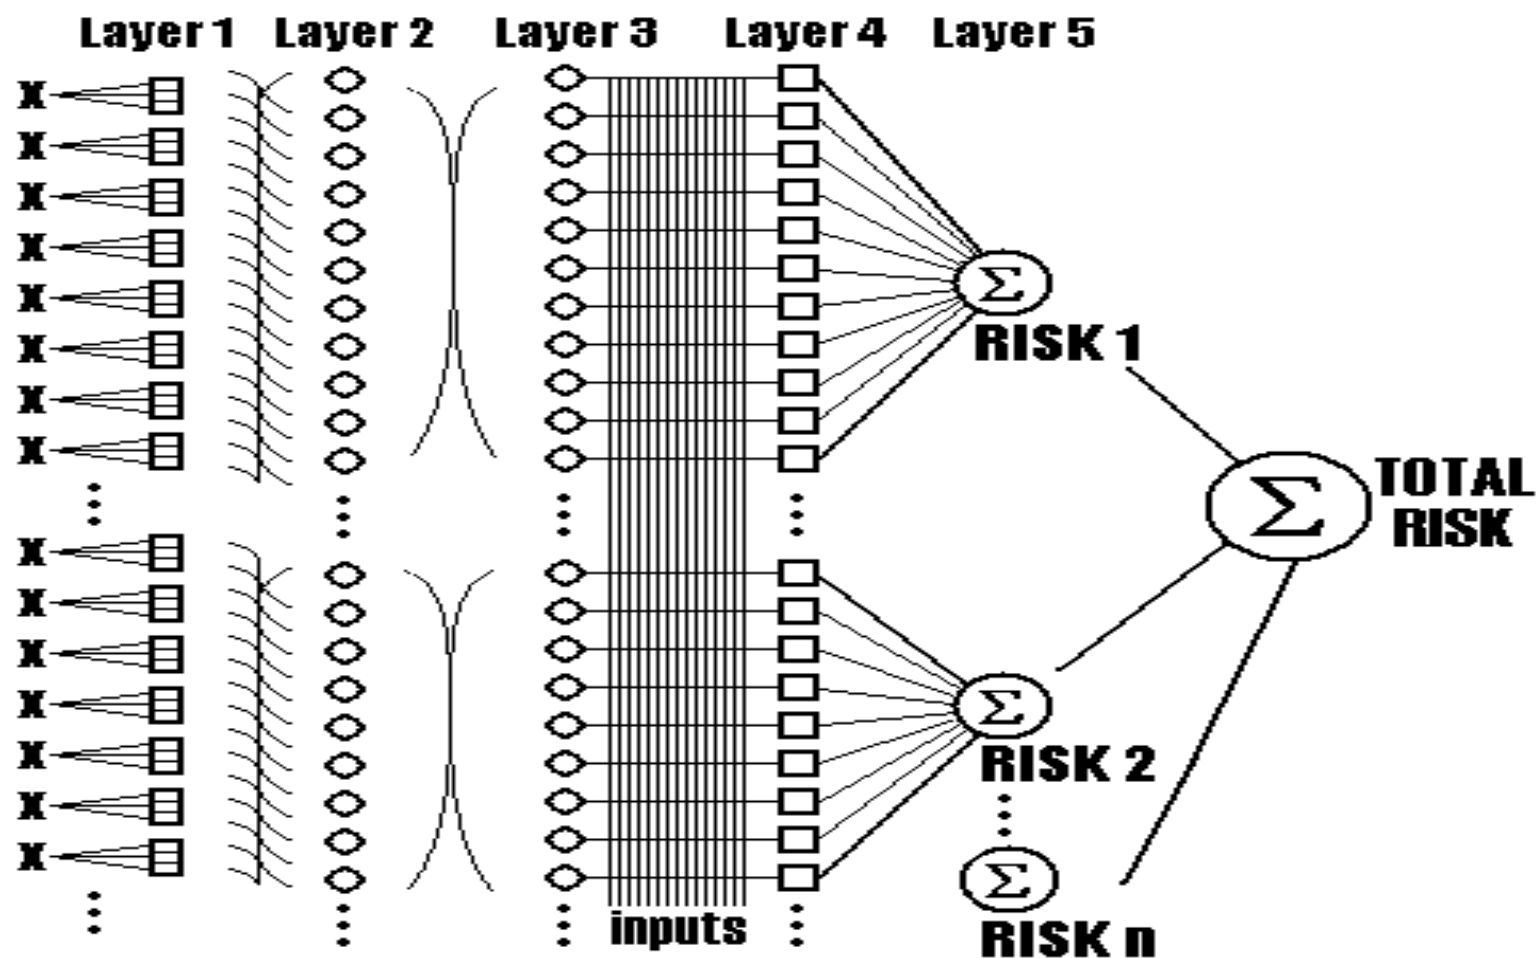

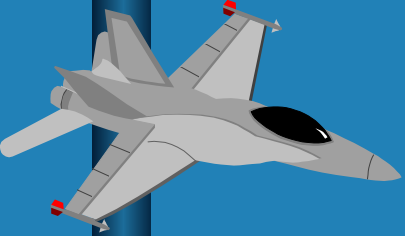

Model Advantages

- ⊗ Apply to all risk categories
- ▮ Customizable to different safety environments
- ▮ Adapt to technological and procedural changes in airline environments
- ▮ Use data and expert judgments in a unified model

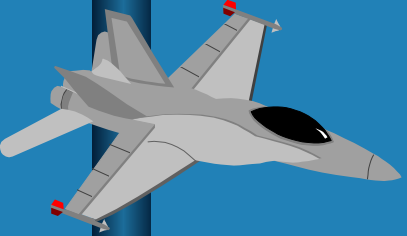

Network Model

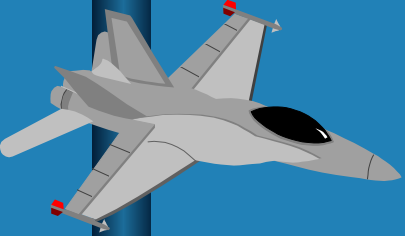

Sample Model Inputs

- Weather (detailed)
- Light/Dark Conditions
- Significant Terrain
- Presence/Type of GPWS
- Management & Organization
- Operations Training
- Scheduling Practices
- Presence of TAD
- Experience Measures
- Recency Measures
- Airport Classification
- Critical Task Times
- English Language Skills
- Deferred Maintenance
- NOTAMS

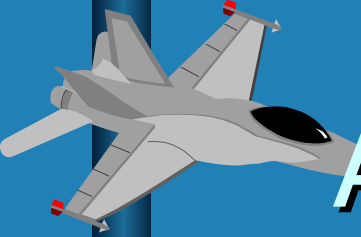

What Inputs are Most Relevant?

- ▮ Classifying inputs in Phase I
 - ⊗ CFIT checklist
 - ▮ AHP (Phase I)
- ▮ Classification Refinements in Phase II
 - ▮ Indirect capture of essential elements:
 - ▮ Example: “time of day” - provides indirect information on weather, crew performance, or ATC functionality
- ▮ Issue of economizing inputs

Model Parameters

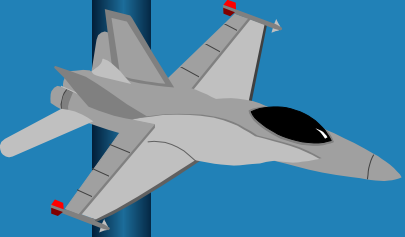

- ⊗ Risk dependent upon
 - Raw inputs
 - Requires highest and lowest possible values
 - Normalized to 0 -1 scale
 - Shape of membership functions
 - Capability to modify membership functions
 - Representation of rule conclusion
 - All rules may not require all inputs. This would reduce complexity.

An Explosion of Variables

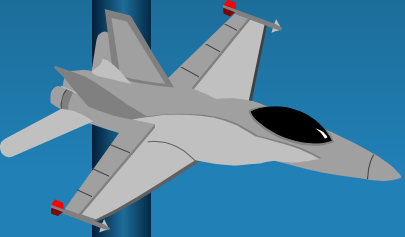

Number of membership functions for each input = 3

#Inputs	#Nodes	# α
2	36	27
3	94	108
4	260	405
5	750	1,458
6	2,212	5,103
7	6,590	17,496
8	19,716	59,049
n	$4n+3^{n+1}+1$	$(n+1)3^n$

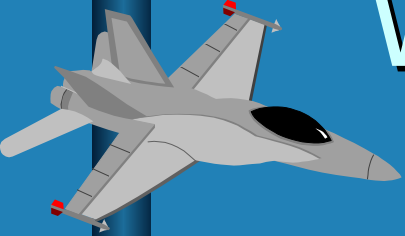

Model Issues

- ⊗ Accomodating more input variables
 - ⊗ Reducing number of model parameters
- ▮ Use of training data and testing data
 - ▮ Model development used artificial data
 - ▮ Different data sets must be used to train and to test
- ▮ Generating target values
 - ▮ Model development used artificial targets
 - ▮ Strategies for simplifying target acquisition
- ▮ Validation strategies

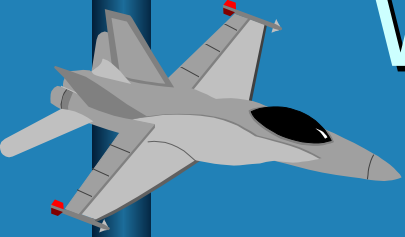

WEATHER COMPONENT *OVERVIEW*

August 1999
AT&T Morristown

WEATHER AS A PART OF FORAS

- ▮ Weather plays a significant role in certain aviation risk factors.
- ▮ The FORAS system must be sensitive to weather changes that change risk profiles.
- ▮ In the phase-2 system, historical weather information and statistics will be used.
- ▮ The historical weather data will provide a baseline until real-time weather is available.

WEATHER AS A PART OF FORAS

☼ WEATHER DATA

- Observations
- Forecasts
- Forecast skill
- Climatology

▮ APPLICATION

- Decoding
- Interpretation
- Climatology Analysis
- Forecast skill analysis

Photo by Greg Thompson

AN IMPORTANT ROLE IN RISK ASSESSMENT *AN EXAMPLE*

☼ CLIMATE DATA:
Historical weather data shows that on average fog rolls into SFO most mornings and lingers until noon.

☼ FORAS
INTERPRETATION:
Morning flights at SFO should have more CFIT risk than afternoon flights due to the increased occurrence of fog conditions.

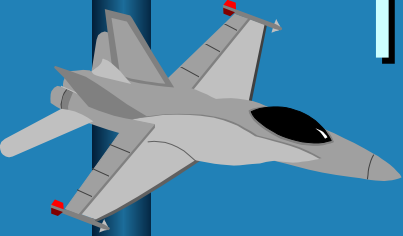

AN IMPORTANT ROLE IN RISK ASSESSMENT

☼ Forecasted

Weather: Inaccurate forecasts will lead to higher risk as users of the forecast may ignore information or users may make incorrect decisions based on the inaccurate forecast.

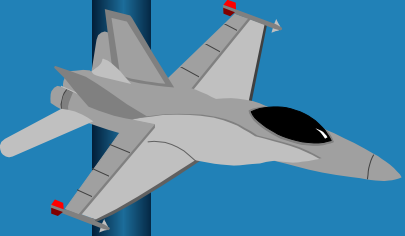

☼ Hypothetical example:

- Heavy rain is forecasted by NWS at ORD.
- When heavy rain is forecasted by NWS at ORD, heavy rain occurs X percent of the time.

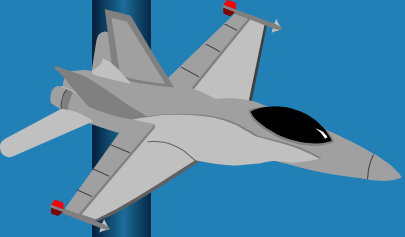

Three Tiers of Weather Information

- Climatology: A statistically based averaging of local weather over specified time periods.
- Weather Data Collection: Acquiring and decoding of current forecasts and observations for Phase II development and verification.
- Forecast Verification: Re-calibration of forecasted weather to reflect the expected outcomes associated with various forecasts.

Summary of Work Accomplished

- ⦿ **Weather Data Structure and Data Sources identified and reside at NCAR.**
- ▮ **Work Plan developed in response to FORAS needs and future goals.**
- ▮ **An aviation weather climatology for Denver, Chicago, San Francisco and Washington Dulles (UAL hubs) has been created with coding that is easily extendable to approximately 250 U.S cities.**

Climatology

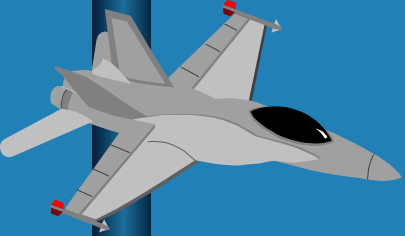

- ☼ Percent occurrence of specified weather phenomenon

- ☼ Parameters

- Flight Conditions
- Hourly Changes in Flight Conditions
- Ceiling Heights
- Visibility
- Runway Visual Range
- Precipitation and Intensity
- Altimeter Setting
- Temperature Minus Dewpoint
- Temperature
- Wind Speed and Direction
- Gusting Winds
- Variable Winds
- Hourly Changes in Wind Speed

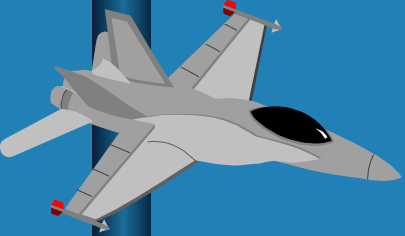

- ☼ Time Periods

- Hourly by Month/over Year, Tri-hourly by Month/over Year, Daily over Year, Weekly over Year, Monthly over Year, Yearly

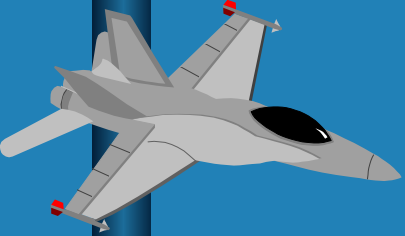

METAR and TAF Data Collection

- ✿ Establishing the format and content of data for use within the overall FORAS product.
- ▮ Collecting data for use in FORAS system development and verification, as well as in the Forecast Verification Analysis.
- ▮ Currently collecting NWS TAFs and METARS and also United Meteorology Department's airport hub TAFs.

Forecast Verification

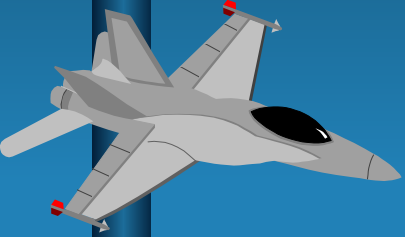

- ☼ An analysis to determine the conditional probability of weather occurrence given its forecast. Analysis will include location, time, weather type and forecast type. For example,
 - NWS TAF for ORD predicts light snow.
 - Historical data analysis shows that there is X% actual occurrence of light snow given this forecast.
 - FORAS INPUT AND INTERPRETATION:
 - Actual probability of the occurrence of light snow given above forecast.
 - Risk caused by incorrect forecasting.

QUESTIONS?

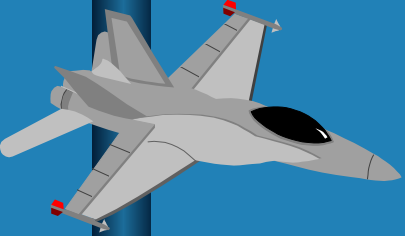

Photo by Greg Thompson

Flight Operations Risk Assessment System

Industry/Data Collaborations

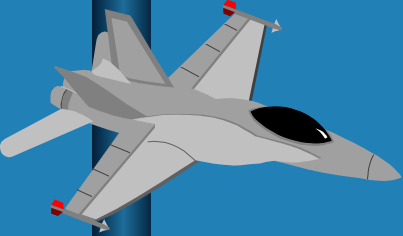

Industry Collaborators

- ▢ United Airlines
- ▢ Airbus Industrie
- ▢ Pilots from other airlines - major, cargo, regional
- ▢ Delta Airlines - Dispatchers
- ▢ ATC Controllers - Daytona Beach and Monterey
- ▢ Aviation Professionals - ERAU
- ▢ Weather Experts - NCAR, NWS

What Has UAL Partnership Provided?

- ⊙ Expert elicitation sessions involving
 - Pilots (sessions at UAL Flight Training Center)
 - Dispatchers (including air traffic coordinators)
- ▢ Data discussions with Information Services
- ▢ Discussion and feedback
 - Pilots, cabin attendants, safety personnel, dispatchers, meteorology, flight operations personnel
- ▢ Modeler liaison - Grant Sullivan
- ▢ Jumpseat time - Diana Boyd

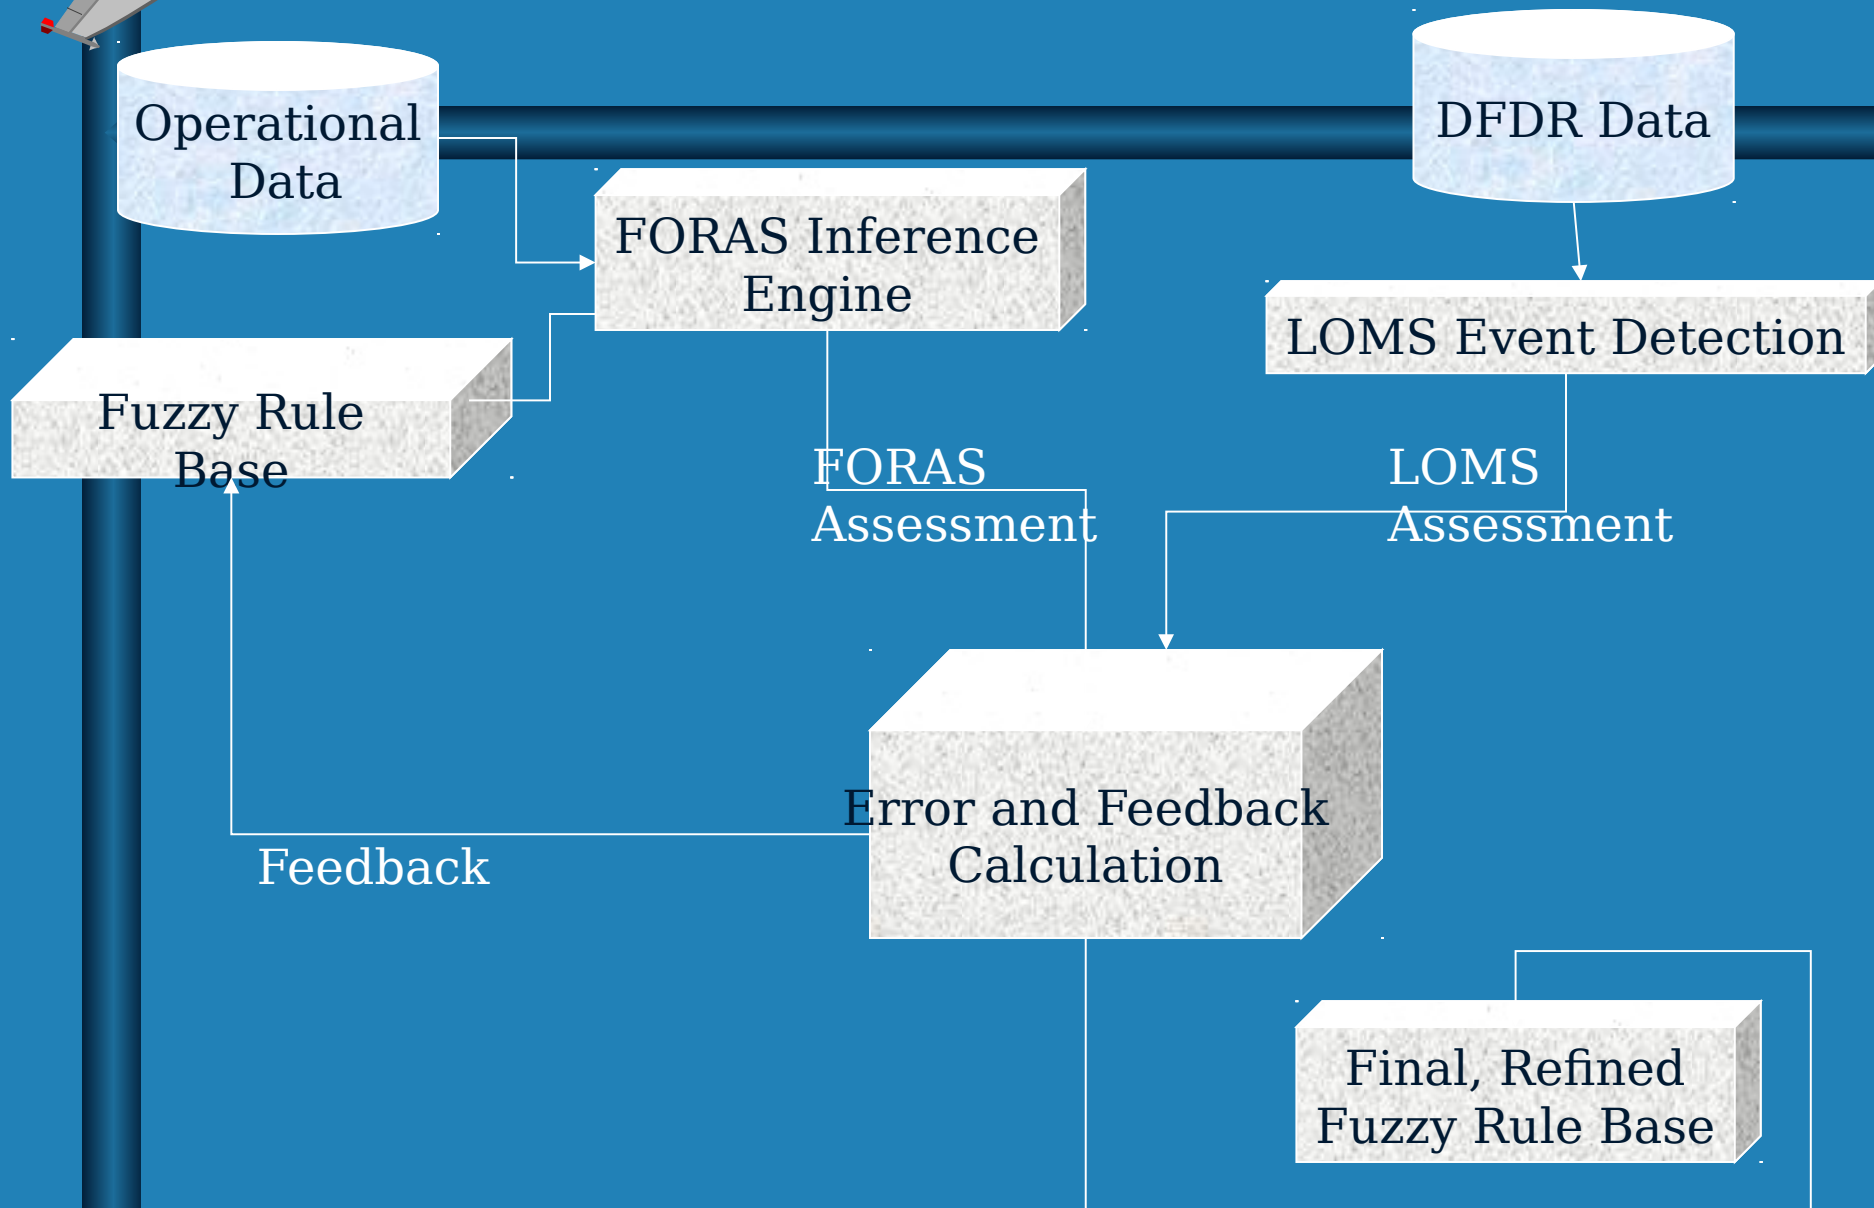

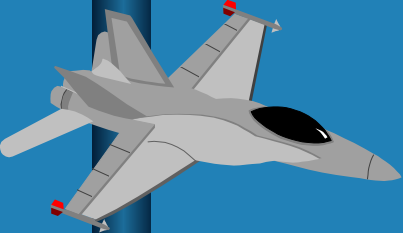

Collaboration with Airbus Industrie

- ⦿ Airbus has a product (LOMS) to measure performance using FOQA-type inputs
- ▣ Potential for LOMS-related data to be used within FORAS
 - to provide targets for selected flights
 - to provide inputs for real-time model
- ▣ Opportunity for international airline partner to provide training and testing data
- ▣ Advantage for Airbus - enhancement of LOMS

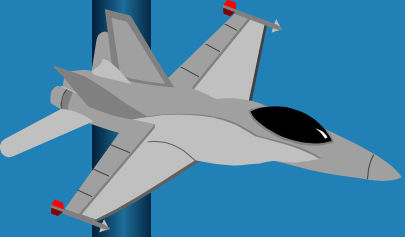

Adaptive Feedback Rule Base Generation -- FORAS + LOMS

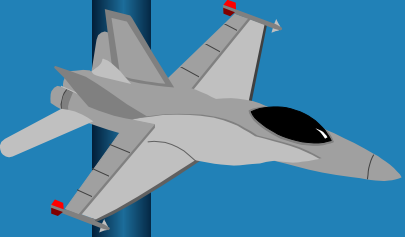

Immediate Data Needs

- Identify an airline that is willing to provide data
 - Option 1 - provide de-identified flight information to FORAS modelers for training and testing of model; or
 - Option 2 - firewall data and provide resources for airline personnel to conduct analysis guided by FORAS modelers
 - What data?...

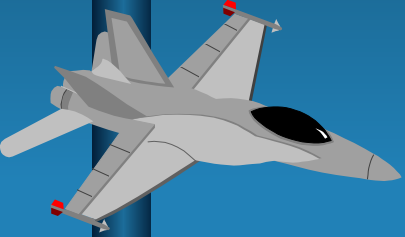

Specific Data Requirements

- ⊗ One record per flight
- ▮ Under current expectations for inputs...
 - At least 10,000 flights required for training
 - If limited to testing, only 2,000 flights required as long as flights represent all input combinations
- ▮ For flexibility in training and testing, more flights are desired

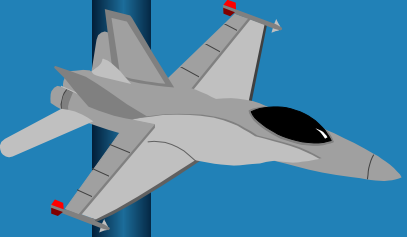

Model Validation

- ▮ Source of expert judgments: pilots or others?
- ▮ Two strategies under consideration:
 - ① Collect risk estimates with experts ranking flights as high, medium, or low risk; compare results with model output
 - ② Collect risk estimates with experts providing numerical estimates of CFIT risk; compare results with model output
- ▮ Use of aircraft performance data as target value?

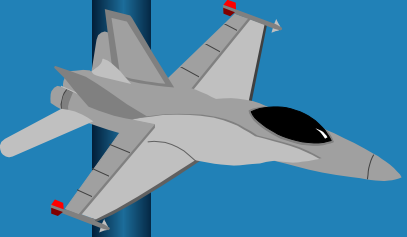

Flight Operations Risk Assessment System

FORAS Future
Plans/Requirements

End of Phase II Goals

- ⚙ Develop prototype user interface
 - ▢ Complete development of prototype
 - ▢ Identify and use data for model training and testing

Phase II Model Inputs

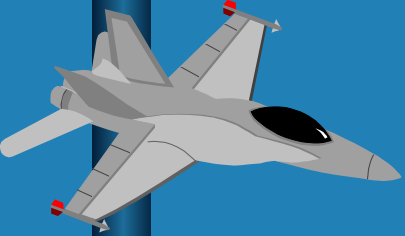

☼ Weather inputs

- Meteorological conditions
- Thunderstorm presence and intensity
- Variability of flight conditions

▮ Airport classification

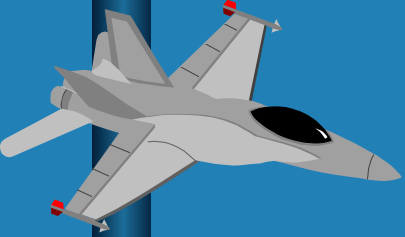

▮ Departure and arrival airports

▮ Time of day

Additional Inputs (data permitting)

- ▢ Pilot In-type experience
- ▢ Availability of EGPWS
- ▢ Management safety survey
 - Organizational structure
 - Training programs

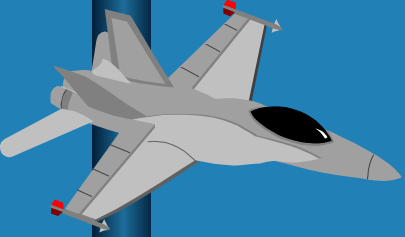

Future FORAS Development

☼ CFIT work

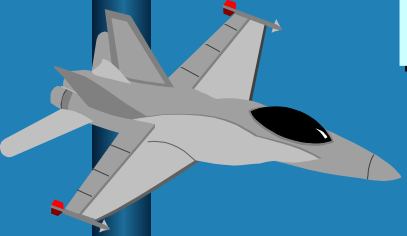

▮ Additional model refinement

- Accommodate larger number of inputs
- Incorporate “clustering” ability
- Modularize inputs
- Incorporate technique for updating model
 - batch processing
 - online adaptation

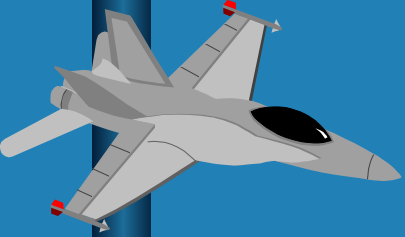

Future FORAS Development

- Use of technique to develop overall accident relative risk assessment system
 - Identify “significant” accident risk categories
 - Identify inputs for each significant risk category
 - Develop additional membership functions, as required
 - Develop expert system functionality for risk mitigation

Future Goals for FORAS Weather

- ⦿ Further research on weather phenomena associated with additional risk categories (e.g.turbulence)
- ▮ Comprehensive forecast accuracy study
- ▮ Climatology expansion and further analysis
- ▮ Creation of an expanded aviation weather database necessary to support other risk categories
- ▮ Evaluation of weather needs for real-time FORAS system

Extension to Other Environments

- ☼ International operations
 - ▮ Military
 - ▮ Regional and commuter airlines
 - ▮ General Aviation
